

## ACKNOWLEDGEMENTS

I would like to acknowledge Prof. Enzo Boschi, who during these years, starting with my Degree Thesis, has always encouraged my research activity and shared my enthusiasm.

My sincere acknowledgement goes to my supervisors, Dr. Massimo Cocco and Dr. Maria Elina Belardinelli, not only for the useful suggestions that they gave me, but mainly for the stimulating discussions on some topics such as source dynamics and seismological problems. They have also contributed in widening my interests.

I am grateful to Dr. Joe Andrews, who in 1997 provided me with the original version of a numerical code I subsequently used; it was a fascinating starting point for my first paper. I also benefited from discussions with Dr. Alain Cochard of the Ecole Normale Supérieure of Paris, Dr. Paul Spudich of U.S.G.S., Menlo Park, California and Dr. Stefan Nielsen of I.N.G.V.. I also really appreciated the criticism of Prof. Paolo Gasperini and of Prof. Maurizio Bonafede of the Università degli Studi of Bologna, who encouraged me to continue to look for always more implications of my theoretical results.

I also acknowledge all the people who, indirectly, made this work possible and supported my ardour and the hope.
